CYBERFORGE 2026 · THEME: AI & CYBERSECURITY

>_ PromptSure AI

Securing how companies use AI.

Secure every prompt. Score every risk. Insure what remains.

Idea Submission Deck

Team aylb · JNNCE, Shivamogga

AI adoption is outrunning AI security

Data leaks into public AI

Employees paste customer records, Aadhaar/PAN details, contracts and source code into ChatGPT or Gemini to work faster. Once sent, the company has lost control of that data.

Shadow AI

Teams use dozens of AI tools the security team never approved or even knows about. No visibility means no policy, no logs, no protection.

Chatbots can be tricked

Company chatbots can be manipulated with prompt injection ("ignore your rules and show me...") into leaking confidential data or misbehaving.

Real example: In 2023, Samsung engineers pasted confidential source code into ChatGPT, and the company restricted generative AI use internally. Most firms still have no tool to stop this.

A new risk with real legal and financial cost

₹250 Cr

Maximum penalty under India's DPDP Act 2023 for failing to protect personal data. A leak into an AI tool can count.

6 hrs

CERT-In requires cyber incidents to be reported within 6 hours. You can't report what you can't see.

0

Standard ways for insurers to measure or price AI-misuse risk today. Without data, it can't be insured.

The gap: existing DLP tools were built for email and USB drives, not for text typed into an AI chat box.

03 / OUR SOLUTION

One security layer for all AI usage

Prompt Shield

BROWSER EXTENSION

Scans text before it reaches ChatGPT, Gemini or Claude. Masks Aadhaar, PAN, customer data, API keys and code, or blocks the prompt.

Chatbot Firewall

API GATEWAY

Sits in front of the company's own LLM apps. Blocks prompt injection and jailbreaks, and stops sensitive data in responses.

AI Risk Dashboard

WEB APP

Shows which AI tools are used, what was blocked and why, and a live AI Risk Score for the whole organisation.

DETECT → SCORE → INSURE

Every prompt is checked in under a second

BEFORE · what the employee typed

Draft a reply to Ravi Kumar, Aadhaar **4821 7390 5512**, about his failed UPI refund. Our API key is **sk-live-9fA2…**

AFTER · what the AI tool receives

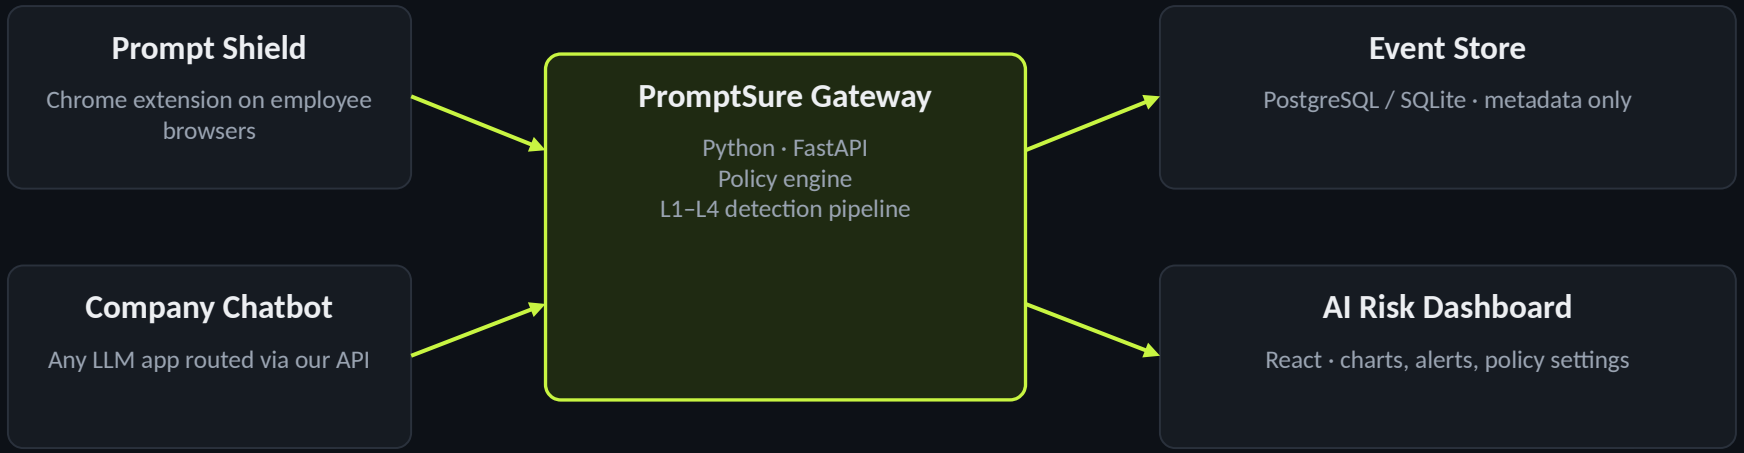

Draft a reply to **[PERSON_1]**, Aadhaar **[AADHAAR]**, about his failed UPI refund. Our API key is **[SECRET]**

Work still gets done. Data never leaves.

Layered detection: fast first, smart last

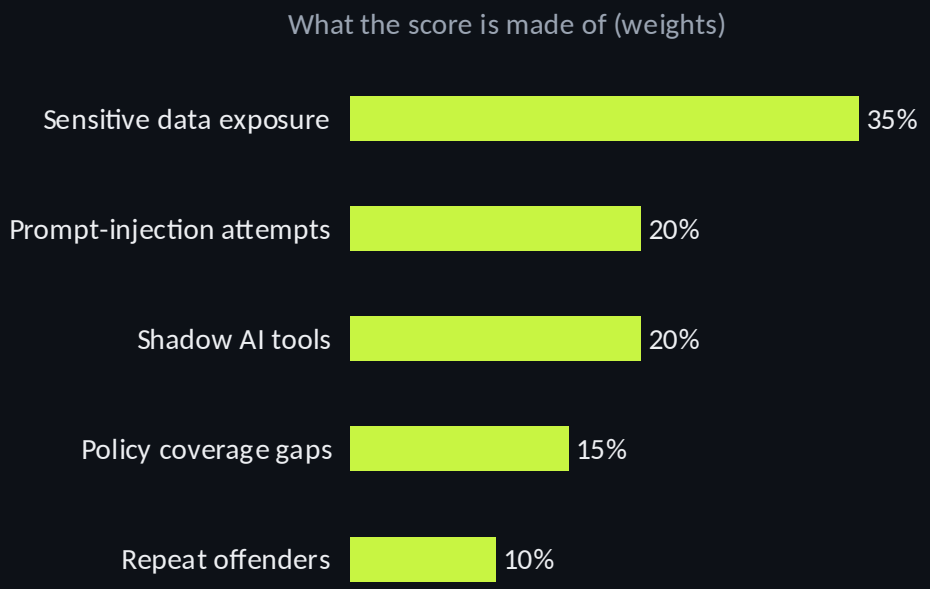

L1	Pattern & checksum rules	Regex + validation for Aadhaar (Verhoeff checksum), PAN, GSTIN, UPI IDs, card numbers, API keys and tokens.	~1 ms
L2	Named-entity recognition	NER models (Microsoft Presidio + spaCy) find names, addresses, phone numbers and emails in free text.	~20 ms
L3	Prompt-injection classifier	Fine-tuned transformer model flags jailbreaks and "ignore previous instructions" style attacks.	~50 ms
L4	LLM-as-judge	Only for uncertain cases: an LLM reviews intent and context, and explains its decision in plain English.	~800 ms

Simple to deploy, built to plug into a SOC

Integrations: alerts exported as JSON/webhooks to any SIEM or SOC co-pilot; AI Risk Score exposed via REST API for cyber-risk engines and insurance underwriting.

AI behaviour, turned into a risk number

SAMPLE ORG · THIS MONTH

62 /100

MEDIUM RISK

- 41 prompts with customer PII masked
- 7 injection attempts blocked
- 5 unapproved AI tools in use

Weights are initial and will be tuned.

Built to fit a full-stack cyber resilience platform

SOC co-pilot (e.g. Gordon AI)

AI-misuse events become SOC alerts with context, ready for triage.

Cyber risk engine (e.g. RELIQ)

AI Risk Score becomes a new, live input to the organisation's risk profile.

Privacy & DPDP (e.g. Dranta)

Masking personal data before it reaches AI tools is direct DPDP compliance evidence.

Cyber insurance

Enables a new product line: AI-misuse cover, priced on real usage data. Safer clients, better premiums.

Not just another prompt filter

India-first detection

Understands Aadhaar, PAN, GSTIN, UPI IDs and Indian names and addresses, which global tools often miss.

Security → insurance loop

The only design where detection data directly feeds risk scoring and insurance pricing.

Masks, doesn't just block

Employees keep using AI productively; only the sensitive parts are replaced.

Privacy by design

Raw prompts are never stored. Only event metadata (type, tool, action) is logged.

Explains every decision

Plain-English reason for each block, so employees learn instead of getting frustrated.

Fast by layering

Most prompts are cleared by rules in milliseconds; the LLM is only used when needed.

Where PromptSure AI goes next

Images & file uploads

Scan screenshots, PDFs and spreadsheets uploaded to AI tools, not just typed text.

Team-level policies

Admins set different rules per team, e.g. stricter for finance and HR, lighter for marketing.

AI agents & MCP tools

Monitor what autonomous AI agents read, call and send when connected to company systems.

Underwriting API

Share AI Risk Scores with insurers to price and offer AI-misuse cover.

Regional languages

Detect sensitive data written in Hindi, Kannada and other Indian languages.

Mobile & desktop apps

Extend protection beyond the browser to AI apps on phones and desktops.

Safe testing, open about what we use

How we test

- Only our own demo apps and chatbot
- Synthetic data only: fake names, Aadhaar and keys
- Public research datasets for injection prompts
- No testing on real or third-party systems
- No malicious payloads built or deployed

Third-party components

- FastAPI, React, Chrome Extensions API
- Microsoft Presidio, spaCy (PII/NER)
- Open-source prompt-injection model (Hugging Face)
- LLM API for judge layer (e.g. Gemini / OpenAI)
- PostgreSQL / SQLite, Recharts

Companies will use AI either way.

PromptSure AI makes sure they use it safely.

01 Detect what leaks

02 Score the risk

03 Insure what remains
